

New Product – Interchar Fire Bolt Caps

We, the DBP have discovered a new product which we feel warrants a place on our site. It is the **Interchar Fire Bolt Cap** and it is used instead of painting the bolts on site. If you consider that most bolts usually require an additional treatment before painting then this product seriously reduces time working at height which in turn reduces the risk of accidents.

For Further information and full product details visit –

<http://www.international-pc.com/products/fire-protection/interchar-bolt-caps.aspx>

Before Fire

After Fire

Key Points:-

1. The caps can be fitted on site by the erectors whilst the structure is being erected so it reduces time working at height.
2. The bolts do not need to receive any other treatment such as etch priming so again less time working at height and no handling of acid primers.
3. The caps are easy to fix as they just push over the bolt head and nut.
4. There is a reasonable amount of clearance so fully threaded bolts should not hinder the use of the caps.
5. They are made of a ceramic looking material which gives a 2 hr fire rating.
6. The cost should be cheaper than site painting bolt heads.
7. They can be provided in any RAL colour (for an additional cost).
8. This is a neat, simple and safe alternative to site painting of bolts.

Warning

This is a new product so ensure you check it out fully!
