

WIRELESS CALL POINTS FOR CONSTRUCTION SITES

Fast and effective means of raising alarms on Construction sites is vital and it is not always possible to have a wired system due to remote location and lack of services.

Wireless systems are now available that can incorporate a variety of alarms such as –

- Fire alarm
- First aid alarm
- Environmental alarm (e.g. Chemical spills)

The systems raise the alarm with sound and flashing lights and can be configured to call the Emergency services, a designated Site contact or both. The systems can be provided to an IP rating of IP67 so are suitable for all sites and all weather conditions and are also available as Intrinsically Safe (IS/Ex) for explosive areas such as Chemical Sites.

These systems have been in place on such projects as Overbury, Sellafield (Bepps Dif project) and HZI Miller Hill. For a relatively small cost they could make a massive difference to the Emergency response.
