

Concrete Floor Scabbler Attachment

Scabblers are used to roughen or reduce the concrete substrate to create a roughened surface. This provides a better bond or key to the finished floor material i.e. concrete, screed, etc.

Traditionally floor scabblers are hand operated machines similar to the image to the right.

A better alternative where a machine can gain access is a scabbler attachment. This alternative is quicker and more efficient. It also exposes the operator to far less noise and vibration.

Restrictions

1. Floor loadings
2. Access for the machine
3. Available Floor Space
